HW #8 – A Travel Reservation System in Bash

Program Summary

For this project, you'll write a bash script to implement a GUI for a travel reservation system. You will use the dialog command to create GUIs with which the user will interact. Your script should do the following:

- create a dialog box to ask for the traveler's name;
- display a list of cities from which the traveler may depart (include 7 or more cities);
- display the same list of cities to which the traveler may be heading;
- display a calendar dialog to find when the traveler is leaving;
- display a calendar dialog to find when the traveler is returning;
- ask the user how many bags they will be checking;
- display a summary of this information on the terminal;
- search a file named "res.txt" (in the current directory) for the user's name (be careful, there could be a traveler named “Paris”). If they already have a reservation, remove that reservation from the res.txt file;
- add the user's reservation to the res.txt file. You should store this as a single line in the following format:

```
name|number of bags|departure city|destination city|departure date|return date
```

All interaction and display, other than starting the program, should be done through Dialog displays.

Additional Features/Bonus Points

You can earn 4 bonus points for each of the following (a total of 20 points possible):

- removing the departure city from the list of destination cities
- not allowing departure before today
- not allowing a return date earlier than the departure date
- telling the user – as soon as they enter their name – if they have a pre-existing reservation, showing them details, and giving them the option of replacing it or keeping it (and exiting)
- showing the user their info at the end and asking for confirmation before writing to the res.txt file

Team Details

You'll be working in teams of 1-4 people for this project. Everyone in your team will receive the same grade (so pick your teammates carefully!)

Submission Details

Only one team member should submit the group's project; make sure every member's full name is listed in the comments in the beginning of the program. Submit your script to Canvas as a single file.

Late Submissions

Late submission will be accepted (10% per day penalty as usual), but all submissions must be received by the start of class 1, week 11 (Nov 30 or Dec 1 for the in-person or remote sections, respectively). If a team hasn't submitted by then, all team members will receive a 0. If you have a DSS accommodation and need a DSS-related extension, you must let me know as soon as possible.

Presentations

Each team will give a short presentation of their project to the class (week 11, class 1). **This is mandatory in order to receive a grade higher than 0.** Presentations may be done by one team member, or by multiple members. Plan on a roughly 5-10 minute presentation. At the start of your presentation, you must clearly state the full name (something I can match to Canvas) of each team member. Then go over the basic features described above under "Program Summary." Then indicate clearly which if any additional/bonus features you implemented, and demonstrate those.

At a minimum, your presentation should include:

1. showing the contents of the starting res.txt file;
2. making a new reservation and showing the modified res.txt file;
3. making a second reservation and showing the modified res.txt file;
4. making a new reservation under the same name as an existing reservation and showing the resulting res.txt file; and
5. any bonus features for which you want credit.

Please ask (early!) if you have any questions!
